Conclusion

Fixed: Symmetric Boolean function $h: \{0, 1\}^k \rightarrow \{0, 1\}$.

Given: Oracle access to $f_A: \{0, 1\}^n \rightarrow \{0, 1\}$ with $n \gg k$ defined by

$$f_A(x) = h(x_A)$$

for some k -subset A .

Task: Learn the function, i.e., find A .

Conclusion

Fixed: Symmetric Boolean function $h: \{0, 1\}^k \rightarrow \{0, 1\}$.

Given: Oracle access to $f_A: \{0, 1\}^n \rightarrow \{0, 1\}$ with $n \gg k$ defined by

$$f_A(x) = h(x_A)$$

for some k -subset A .

Task: Learn the function, i.e., find A .

- We identify $x \in \{0, 1\}^n$ with the subset $S \subseteq [n]$.
- Different from usual junta learning:
 - function h is fixed,
 - no PAC learning.

Conclusion

Fixed: Symmetric Boolean function $h: \{0, 1\}^k \rightarrow \{0, 1\}$.

Given: Oracle access to $f_A: \{0, 1\}^n \rightarrow \{0, 1\}$ with $n \gg k$ defined by

$$f_A(x) = h(x_A)$$

for some k -subset A .

Task: Learn the function, i.e., find A .

- There are $\binom{n}{k}$ possible outcomes.

Requires

$$\log \binom{n}{k} = \Omega \left(k \log \frac{n}{k} \right) \text{ randomised queries.}$$

More on Group Testing

Quantum Lower Bound due to Ambainis and Montanaro (2013)

Consider the case $n = k + 1$.

- If we query $S = \emptyset$, the answer is always 0.
- If we query S with $|S| > 1$, the answer is always 1.

Equivalent to the search for the unmarked element.

Requires $\Omega(\sqrt{k})$ quantum queries.

Our Results

Group Testing

Other Functions

Conclusion

- We prove a tight $O(\sqrt{k})$ upper bound for group testing.
- We give an alternative formulation for a general h .
- We construct a $O(k^{1/4})$ **quantum** query algorithm when
 - $h = \text{EXACTLY-HALF}$ (tight);
 - $h = \text{MAJORITY}$.

Analysis

Other Functions

Conclusion

We have constraint

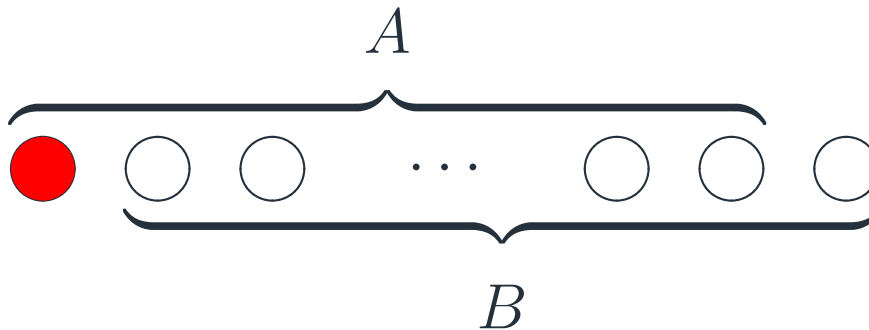

$$\sum_{S: f_A(S) \neq f_B(S)} X_S[A, B] = 1.$$

“Hardest” when A and B differ in 1 element:

Hard Case: Constraint

$\sum_{S: f_A(S) \neq f_B(S)} X_S[A, B]$ is the probability of $f_A(S) \neq f_B(S)$:

- It equals $2p(1 - p)^k$.
- In X_S we include A satisfying $|A \cap S| \leq 1$.

- Conclusion

$$X_S = \alpha \begin{pmatrix} \beta \Pr[S] & \Pr[S] \\ \Pr[S] & \frac{\Pr[S]}{\beta} \end{pmatrix}$$

$A \cap S = \emptyset \quad |A \cap S| = 1$

$A \cap S = \emptyset$
 $|A \cap S| = 1$

Objective: $\frac{(1-p)^k}{kp(1-p)^{k-1}}$ $\frac{1-p}{kp} \rightarrow \sqrt{kp(1-p)}$

Constraint: $2p(1-p)^k$ $2p(1-p)$

By plugging $p = 1/2$ and rescaling, we get complexity $O(\sqrt{k})$.

Probabilistic Language

Hard Case

Constraint

Objective Value

Analysis

General Case

Analysis

Other Functions

Conclusion

$$X_S = \left(\begin{array}{c} |A \cap S| \leq 1 \\ \Pr[S] \\ |A \cap S| \leq 1 \end{array} \right)$$

$$\text{Objective: } \begin{array}{l} (1 - p)^k \\ kp(1 - p)^{k-1} \end{array}$$

$$\text{Constraint: } 2lp(1 - p)^{k+l-1}$$

General Case: Analysis

- Introduction

- Group Testing

- Main Tool
- Probabilistic Language
- Hard Case
- Constraint
- Objective Value
- Analysis
- General Case
- Analysis

- Other Functions

- Conclusion

$$X_S = \alpha \begin{pmatrix} \beta \Pr[S] & \Pr[S] \\ \Pr[S] & \frac{\Pr[S]}{\beta} \end{pmatrix} \begin{matrix} A \cap S = \emptyset \\ |A \cap S| = 1 \end{matrix}$$

Objective: $\frac{(1-p)^k}{kp(1-p)^{k-1}} \cdot \frac{1/(2p)}{k/(2(1-p))} \rightarrow \sqrt{\frac{k}{4p(1-p)}}$

Constraint: $\frac{2lp(1-p)^{k+\ell-1}}{\ell(1-p)^{\ell-1}}$

General Case: Analysis

- Introduction

- Group Testing

- Main Tool
- Probabilistic Language
- Hard Case
- Constraint
- Objective Value
- Analysis
- General Case
- Analysis

- Other Functions

- Conclusion

Objective: $(1-p)^k$ $1/(2p)$ \longrightarrow $\sqrt{\frac{k}{4p(1-p)}}$
 $kp(1-p)^{k-1}$ $k/(2(1-p))$ \longrightarrow

Constraint: $2lp(1-p)^{k+l-1}$ $l(1-p)^{l-1}$

Now we integrate by p from 0 to 1:

$$X_S = \int_0^1 X_S(p) dp$$

$$\frac{\sqrt{k}}{2} \int_0^1 \frac{dp}{\sqrt{p(1-p)}} = \frac{\pi\sqrt{k}}{2}$$

$$\int_0^1 l(1-p)^{l-1} dp = 1.$$

Introduction

Group Testing

Other Functions

Scheme

Equivalent Formulation

Applications

Conclusion

- From basic properties of \mathcal{N}_k , we get a $O(k^{1/4})$ upper bound for
 - MAJORITY and EXACTLY-HALF.
- The result for EXACTLY-HALF is tight.

- Adversary bound rules!
- Optimal algorithms for OR and EXACT-HALF.
- Super-quadratic separation between randomised and quantum query complexities.

- MAJORITY ?
 - Is it more like XOR, or like OR ?
 - We know that:
 - Bernstein-Vazirani style approach fails,
 - simple lower bounds fails.

- Other functions: t -THRESHOLD, EXACTLY- t ?

- Further applications of these results and techniques ?
